                                                                                                                                                                                                                                                                                                                                                                                                   120
                                                                                                                                                             A novel cytokine (AAW19777), designated Apo-2 ligand, induces mammalian cell apoptosis. It is belived to be a member of the tumour necrosis factor cytokine family. Its amino acid sequence was deduced from a cDNA clone (AAT72796) isolated from a human placental cDNA library. Apo-2 ligand polypeptides, esp. those corresponding to amino acids 114-281, 41-281, 15-281 or 1-281 of Apo-2 ligand, can be produced by culturing cells transformed or transfected with a vector contg. Apo-2 ligand nucleic acid. They can be used to induce apoptosis in mammals and to treat pathological conditions such as cancer (esp. breast or colon cancer) or to raise antibodies useful in diagnostic assays

The present sequence represents a human Apoptosis inducing molecule-I (AIM-I). AIM-I is a member of the tumour necrosis factor (TNF) ligand superfamily. The products can be used in the diagnosis and treatment of disorders related to under-expression, over-expression or altered expression of AIM-I. AIM-I or agonists can be used for treating autoimmunoproliferative disease lymphadenopathy (IPL), rheumatosus, immunoproliferative lymphadenopathy (IPL), rheumatoid arthritis, angioimmunoproliferative lymphadenopathy (AIL), rheumatoid arthritis, compandats auto as tumour call growth, to treat restenosis, to regulare haematopoiseis in endothelial call development, to stimulate peripheral tolerance and cytotoxic T-cell mediated apoptosis. Antagonists can be used for treating cachexia, cerebral malaria, rheumatoid arthritis or settoporosis, for preventing graft-host rejection, and as anti-illammatory agents, for treating endotoxic shock or to prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated apoptosis inducing molecule-I - used to develop products for
the diagnosis and therapy of e.g. autoimmune diseases, tumours, graft
versus host disease or inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human tumour necrosis factor related apoptosis inducing ligand (TRALL) (AAM19787) is a novel cytokine that induces apoptosis of certain target cells, including cancer cells and virally infected cells. Its amino acid sequence was deduced from cDNA clone HuAIC (AA772848), deposited in vector pDC409 as ATCC 69849. Recombinant TRALL polypeptides (esp. soluble polypeptides) can be expressed in host cells and used in the treatment of cancer (e.g. leuksemia, lymphoma and melanoma) and viral infections, or to raise antibodies that may be useful for treating thrombotic

This sequence represents the human tumour necrosis factor (TNF)-related receptor, TL2 (also known as tumour necrosis factor-related apoptosis-inducing ligand, TRAIL). This protein is used in a method resulting in polyapetides and polynucleotides can be used in the treatment of the novel human TNF related receptor, TR6. TR6 polyapetides and polynucleotides can be used in the treatment of chronic and acute inflammation, arthritis, septicaemia, autoimmune diseases (e.g. inflammatory bowel disease, psoriasis), transplant rejection, graft vs. host disease, infaction, stroke, ischaemia, acute respiratory disease syndrome, restenosis, brain injury, (acquired autoimmune disease syndrome) alds, bone disease, cancer (e.g. lympho-proliferative disorders), atherosclerosis and Alzheimers disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 DDSYWDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DDSYWDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120

                                                                                                                                                                                                                                      This represents a human tumour necrosis factor related apoptosis ligand (TRAIL) polypeptides can induce apoptosis of Jurkat cells. The human and murine TRAIL polypeptides can induce apoptosis of Jurkat cells. The encoding nucleic acid sequences are useful for producing the recombinant TRAIL polypeptides, which may be useful in studies of apoptosis, to purify leukaemia, lymphoma or melanoma cells cells to isolate antigens for vaccine development). The polypeptides can be used to treat leukaemia, lymphoma or melanoma (e.g. by extracorporeal treatment of blood or bone-marrow), or to treat viral infections
Tumour necrosis factor related apoptosis ligand; TRAIL; research; human;
cytokine; therapy; leukaemia; lymphoma; melanoma; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding cytokine TNF-related apoptosis ligand polypeptides - useful for producing recombinant polypeptides for research and therapy of leukaemia, lymphoma, melanoma and viral infections.

```
The present sequence represents human AGP-1. AGP-1 is a tumour-necrosis factor (TNF)-related protein, involved in inflammation, myelopoiesis and bone resorption. It has the same nucleic acid and amino acid (aa) sequences as the TNF-related apoptosis-induced ligand (TRAIL) described in Immunity, 3 (1995) 673. Antibodes (Ab) are used as immunoassay reagents for detecting AGP-1 expression. Nucleic acid complementary to AGP-1 is used to requiate AGP-1 expression and antagonistic compounds are used to treat inflammation (e.g. rheumatoid arthritis, systemic lupus erythematosus, psoriasis, scleroderma, infection-related inflammation) or one resorption diseases (e.g. osteopyzoals, osteomyzolitis, chaematopoietic diseases associated with reduction in the number of bone marrow cells, particularly neutrophils and lymphocytes, e.g. where caused by disease, injury or exposure to myelosuppressive agents. Host cells, transformed with expression vectors containing AGP-1 DNA, are used to produce recombinant AGP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid encoding AGP-1, a tumour necrosis factor-related protein useful for treating inflammation, bone resorption and haematopoietic

The polypeptides can be used in treatment of neurodegenerative disease, The polypeptides can rhuematoid arthritis, and SEP. The polypeptides are apoptotic in central nervous system cells, antigenic and specifically recognise the surface receptor of the TRAIL protein. The polypeptide is a marker of disease and a therapeutic target, e.g. its apoptotic activity can be blocked with an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a novel human cytokine, designated Apo-2 ligand (Apo-2L). The Apo-2L polypeptide can be produced by standard recombinant methodology. Apo-2L is useful for inducing apoptosis in mammalian cancer calls. This is useful for the treatment of cancer. Apo-2L can be used to induce apoptosis for pathological conditions characterized by decreased levels of apoptosis. e.g. autoimmune disorders like lupus and immunemediated glomerular nephritis and cancer. Apo-2L and its nucleic acid
                                                                                                                                                                                                                                                              9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is the human Apo-2 ligand protein, which is recognised by monoclonal antibodies produced by the hybridoma cell lines of the invention. The hybridoma cell lines are deposited under the American Type Culture Collection Accession Numbers: ATCC HB-12256, HB-12257, HB-12258 and HB-12259. The Apo-2 ligand antibodies may be used in diagnostic

assays for Apo-2 ligand, e.g. detecting its expression in specific cells, tissues, or serum. The antibodies may also be employed as therapeutics. For instance, anti-Apo-2 ligand antibodies which block Apo-2 ligand activity, like Apo-2 ligand-induced apoptosis, may be employed to treat pathological conditions or diseases associated with increased apoptosis. They are also useful for the affinity purification of Apo-2 ligand from recombinant cell culture or natural sources. The Apo-2 ligand itself may be used to treat diseases e.g. cancer, by inducing apoptosis in cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Š
                                             The present invention describes an antibody that binds to a human protein (I) selected from: PRO1381; PRO1269; PRO1410; PRO1755; PRO1780; PRO3341; PRO4357; PRO1295; PRO1295; PRO1295; PRO1295; PRO1295; PRO2295; PRO3303; PRO4407; PRO4555; PRO1096; PRO2058; and PRO2262; (I) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells.

Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonucleotide which hybridises to genes encoding (I), can be used to inhibit tumour growth, preferably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AAC58019 to AAC58102 represent PCR primers and hybridisation probes used in the AAC5812 and AAB34021 to AAC58102 represent invention for human PRO sequences. AAC58101 to AAC5812 to AAC5

The present sequence represents a human TRAIL (tumour necrosis factor (TNF) related apoptosis-inducing ligand) polypeptide. The specification describes a method for enhanced killing of tumour cells. The method comprises contacting a susceptible tumour cell with a symergistic mixture of a TRAIL receptor ligand and a diterpenoid triepoxide in a combined dosage to kill at least 50 % of the cells. This mixture is symergistic, and so is active at lower doses and against otherwise resistant cell lines. The method is used for killing tumour cells, especially solid tumours or carcinomas (especially mammary carcinoma or non-small cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                             The present sequence is human AGP-1, a type II transmembrane protein. Fusion proteins comprising an FC immunoglobulin region fused to the Neterminal portion of the AGP-1 protein have been produced. The fusion proteins can be used to induce apoptosis in a tissue, and to treat proliferative disorders, immune disorders, or virally-induced disorders. The proliferative disorders include cancers, such as breast, prostate, lung or colon cancer. The viral infections include hepatitis, and acquired immunodeficiency syndrome (AIDS), and the immune disorders may be autoimmune disorders or transplant rejection. Cardiovascular diseases such as arteriosclerosis may also be treated. The AGP-1 containing fusion proteins used in prior art therapies

                                                                                                                                                                                                                                   The present sequence is one of twenty eight novel PRO polypeptides. The PRO polypeptides and their agonists, including antibodies, peptides, and small molecule agonists, may be used to treat various tumours, e.g., cancers such as breast cancer, ovarian cancer, renal cancer, colorectal cancer, uterine cancer, prostate cancer, lung cancer, bladder cancer, central nervous system cancer, melanoma or leukaemia. They are also useful for treating other disorders such as neuronal, glial, astrocytal, hypothalamic and other glandular, macrophagal, epithelial, stromal and blastocoelic disorders, and inflammatory, angiogenic and immunological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
Twenty eight nucleic acids encoding PRO polypeptides which are useful treating various tumors, e.g. breast cancer, and other inflammatory, angiogenic and immunological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    121 RVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNGELVIHEKG

                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a formulation comprising Apo-2 ligand and divalent metal ions. Apo-2 ligand and the formulation are useful for treating cancers and viral infections. Addition of divalent metal ions for making Apo-2 ligand and formulations containing Apo-2 ligand results in increased yield and stability of Apo-2 ligand trimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                     Use of divalent metal ions for making Apo-2 ligand and in formulations containing Apo-2 ligand for increasing Yield and stability of ligand trimers, useful for therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MAMMEVQGGPSLGQTCVLIVIFTVLLQSLCVAVTYVYFTNELKQMQDKYSKSGIACFLKE

The invention relates to a cytokine designated as tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL), which induces apoptosis of certain target cells, including cancer cells and virally infected cells. The TRAIL polypeptides are useful in killing cancer cells, in treating viral infections (e.g. bovine viral diarrhoea or human immunodeficiency virus (HIV)) and cancers (e.g. leukaemia, lymphoma and melanoma), as a research reagent useful in studying apoptosis including the regulation of programmed cell death. TRAIL DNA sequences may be employed in developing a gene therapy approach to treating disorders mediated by defective or insufficient amounts of TRAIL, in the production of TRAIL polypeptides and as probes or primers in polymerase chain reactions (PCR). The present sequence is human TRAIL protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New tumor necrosis factor related apoptosis inducing ligand polypeptides for treating viral infections (e.g. bovine viral diarrhea or human immunodeficiency virus), or cancers (e.g. leukemia or lymphoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a human tumour necrosis factor (TNF) related receptor, TR6. TR6 can be expressed by standard recombinant methodology. The TR6 polypeptides are useful for treating chronic and acute inflammation, rheumatoid arthritis, septicemia, autoimmune diseases (e.g. inflammatory bowel disease, psoriasis), transplant rejection, graft vs. host disease, infection, stroke, ischaemia, acute respiratory disease syndrome, asthma, restenosis, brain injury, AIDS, bone diseases, cancer, atheroselerosis, and Alzheimer's disease. These may also be used to inhibit production of TNF-alpha and eicosanoids, as research reagents and materials for discovering treatments and disagnostics to animal and human diseases. The polypeptides may further be used as immunogens to produce antibodies immunospecific for the TR8 polypeptides. The polypurcleotides may also be used as hybridization probes for CDNA and genomic DNA, for isolating full-length cDNAs and genomic clones encoding TR6 and of other

                                                                                                                                                                                                                                                                                                                                                                          9
genes having high sequence similarity to TR6 gene, and for chromosome identification. The present sequence represents a human TL2 polypeptide. TL2 is also known as TRAIL (TNF-related apoptosis-inducing ligand) and is ligand for the TL2 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to treating an individual at risk for or sufferin from infection with a pathogenic or opportunistic organism. The method involves administering a combination of two to five agents comprising:
                                                                                                                                                                                                                                                                                                                                                                          1 MAMMEVOGGPSLGQTCVLIVIFTVLLQSLCVAVTYVYFTNELKQMQDKYSKSGIACFLKE

(a) dendritic cell mobilisation factor; (b) dendritic cell maturation agent; (c) dendritic cell activation agent; (d) T cell enhancing factor; or (e) activated, antigen-specific Tealls. The methods are useful for treating an individual at risk for or suffering from infection with a pathogenic or opportunistic organism, e.g. viruses (e.g. HIV), bacteria (e.g. M. tuberculosis), yeast, fungi (e.g. C. albicans) or protozoa (e.g. T. cruzi, which causes Chaga's disease). The methods are especially useful for treating an individual suffering from immunosuppression by enhancing a lymphocyte-mediated immune response. In particular, the method is useful for treating inflammations, chickenpox, oral or genital herpes, mononucleosis, multifocal leukencephalopathy, hepatitis, AIDS, T cell leukemia or T cell lymphoma. The activated antigen presenting dendritic cells are useful as a vaccine adjuvant. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a new method for treating a tumourbearing subject. The method involves administering a combination of 2 to 5 agents comprising dendritic cell mobilisation factor, dendritic cell maturation agent, tumour-killing agent, T cell enhancing factor or activated, antigen-specific T cells. The method is useful for treating tumours or cancers in a subject e.g. skin cancer, prostate cancer, liver cancer, tumours of the bone, brain or spinal cord, actinic keratosis, or cervical intraepithelial neoplasia. The present amino acid sequence in the human TRAIL protein that was used in the method of the

                                                                                                                                                                                                  This invention relates to a novel method for enhanced killing of tumour cells comprising contacting a tumour cell with a synergistic combination of a death domain receptor ligand and a diterpenoid triepoxide. This method has cytostatic activity and works by blocking TNF-alpha mediated induction of c-IAP2 and c-IAP1. The method of the invention may be used for treating tumours, particularly solid tumours, e.g. carcinoma, mammary adenocarcinoma and non-small cell lung carcinoma also neurological malignancies, haemacological malignant cutaneous T-cells, mycosis chronic lymphocytic leukaemia, malignant cutaneous T-cells, mycosis fungoides, non-MF cutaneous lymphoma, T-cell lymphoma, lymphomatoid papulosis, T-cell rich cutaneous lymphoid hyperplasia, bullous pemphigoid, discoid lupus erythematosus, lichen planus. The combination may be administered with other active agents, e.g. anti-metastatic, anti-tumour or anti-captive agents. The potent synergy between the diterpenoids and the death domain ligands allows increased killing at equivalent or lower construction and construction sequence. TRAIL is a death domain receptor used in the used construction in combination with diterpenoid triepoxides to with contents invention in combination with diterpenoid triepoxides to

The present sequence is that of human Apo-2 ligand (Apo-2L or TRAIL). The invention relates to methods of inducing apoptosis in mammalian cells, and despecially to the use of Apo-2L receptor agonists and CPT-11 (a chemotherapeutic agent of the topolsomerase I inhibitor class) to synergistically induce apoptosis in mammalian cells, in particular amammalian cancer cells, and sepecially colorectal cancer cells (laimed). The cells may be in cell culture or in a mammal, e.g. a mammal suffering from cancer or a condition in which induction of apoptosis in the cells administering CPT-11 and Apo-2L receptor agonist, where the CPT-11 is administered about 6-72 hours prior to administration of the Apo-2L receptor agonist. Preferred Apo-2L receptor agonist. Preferred Apo-1L receptor agonist. Preferred Apo-1L receptor agonist. Preferred Apo-1L receptor agonist leads to upregulation of DR4 and DR5 receptors. C canti-DR5 receptor agonist leads to upregulation of DR4 and DR5 receptors. C anti-DR5 receptor agonist leads to upregulation of DR4 and DR5 receptors. C arcest and possible DNA repair, thus providing enhanced antitumour cultumour growth by Apo-2L and CPT-11 in athymic nucle mijected s.c. with human colloss colon carcinoma cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240

The present invention describes an Escherichia coli strain (I) deficient in chromosomal degp and prc encoding protease Degp and Prc, respectively, and harbouring a mutent spr gene, the product of mutant spr gene suppresses growth phenotypes exhibited by strains harbouring prc mutants.

(I) is useful for producing a polypeptide, by culturing (I) comprising nucleic acid encoding the polypeptide, which is heterologous to the strain, such that the nucleic acid is expressed, and recovering the strain, such that the nucleic acid is expressed, and recovering the terrologous polypeptide from the strain. The heterologous polypeptide is proteolytically sensitive. Culturing of (I) is performed in a fermentor under conditions of high- or low-cell density fermentation. The polypeptide is an antibody (humanised or full-length antibody) or Apo2 ligand. The antibody is an anti-tissue factor, 2C4, anti-Her-2, anti-CD20, anti-CD40, or anti-CD10 antibody is also an antibody fragment having a light chain (kappa light chain). The antibody fragment having a light chain (kappa light chain). The antibody fragment having a light chain (kappa light chain). The antibody fragment sea Pab, Fab, Fab, Pab, 2 or Fab/2-leucine zipper fusion, anti-Lissue factor Fab/2-leucine zipper fusion with a 6-histidine tag, anti-CD18 (Fab/2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 (Fab/2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 (Fab/2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 (Fab/2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 (Fab/2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 (Fab/2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 (Fab/2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 (Fab/2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 (Fab/2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 (Fab/2-leucine zipper fusion with a 6-histidine tag, and anti-CD18 (Fab/2-leucine zipper fusion with a 6-histidine tag, and paper fus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel Escherichia coli strain useful for producing polypeptide, deficient in degP and prc encoding protease, and harboring mutant spr gene, product of gene suppresses growth phenotypes of strains harboring prc mutants.
                                                                                                                                                                                                                                                                                                                                                                               Bacterial host, protease, degP, prc, spr, anti-VEGF antibody, antibody, humanised, Apo2 ligand, anti-CD18, anti-tissue factor; 2C4, anti-CD20, anti-vascular endothelial growth factor; anti-Her-2, anti-CD40; Fab; anti-CD111; Fab'; Fab'2, Fab'2-leucine zipper fusion; anti-VEGF Fab.

presenting dendritic cells for preventing or treating C. neoformans
infection comprises causing the obtained dendritic cells to present the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method of producing a population of activated, Cryptococcus neoformans antigen-presenting dendritic cells, comprising causing the obtained dendritic cells to present the antigen and maturing the dendritic cells. The activated, C. neoformans antigen expressing dendritic cells are useful for treating, or as vaccines or vaccine adjuvants against, C. neoformans infection, or for generating antigen-specific T cells. The present sequence is a human protein shown in the exemplification of the invention

The invention discloses isolated, naturally occurring, polypeptide splice variants of human tumourn necrosis factor (TRF)-related apoptosis inducing cligand (TRALL). Apoptosis, or programmed cell death, occurs during normal cellular differentiation and development of multicellular organisms.

Collular differentiation and development of multicellular organisms.

CC (also referred to as Apo-2 ligand, Apo-21). TRALL is a type II membrane protein which induces apoptosis and nuclear factors (NF-B) activation in many tissues and cells. Receptors for TRALL include two death domain.

CC containing receptors. DR4 and DR5, as well as two decoy receptors, DCR1 and DR2, lacking the interferons, induces apoptosis in tumour cells, whereas normal cells are relatively resistant without showing significant toxic and beR2, lacking the interferons, induces apoptosis in tumour cells, whereas normal cells are relatively resistant without showing significant toxic and titumour agent. The naturally occurring splice variants may differ in their cellular distribution, expression levels/timing and activity.

CC antitumour agent. The naturally occurring splice variant polyapeptides and polynucleotides can be used in gene therapy, to raise antibodies, to determining these factors could provide possible mechanisms for the confirming these factors could provide possible mechanisms for the antipodice of the splice variant TRALL products and modulate its activity (agonists which bind the variant TRALL products and modulate its activity (agonists and antagonists). Pharmaceutical compositions, comprising an expression vector or any of the antino acid sequences. The artibodies may also have a therapeutic thin amino acid sequences. The antibodies may also have a therapeutic utility in blocking or decreasing the activity of thesess, also and all organisms and products. Diseases that may be treated in clude cacer, neurodegenerative diseases, autoimmune diseases, diseases involved in the non-normal conducting ligand (TRALL) protein the wild-type in 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

The invention relates to an Apo-3 polypeptide having an extracellular domain (BCD) sequence and a death domain sequence. The Apo-3 polypeptide has been found to stimulate or induce apoptotic activity in mammalian cells. Human Apo-3 exhibites similarities to the tumour necrosis factor receptor (TNFR) family of polypeptides. The invention also relates to a chineric molecule comprising an extracellular domain sequence comprising residues 1-198 of Apo-3 fused to a heterologous amino acid sequence. The Apo-3 polypeptide is useful therapeutically to induce apoptosis in mammalian cells. Decreased levels of apoptosis has been associated with conditions such as cancer, lupus, and herpes virus infection. Increased levels of apoptosis are associated with disease such as acquired conditions such as cancer, lupus, and herpes virus infection. Increased levels of apoptosis are associated with disease such as acquired immunodeficiency syndrome (AIDS), Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, multiple sclerosis, retinitis pigmentosa, cerebellar degeneration, aplastic anaemia, myocardial infarction, stroke, reperfusion injury, and toxin-induced liver disease. The Apo-3 polypeptide is also useful in non-therapeutic applications such as in quantitative diagnostic assays for Apo-3, in affinity purification containing unknown quantities of Apo-3 may be prepared, in generating antibodies, as standards in assays for Apo-3, in affinity purification techniques, and in competitive-type receptor binding assays. The chimeric molecule is useful therapeutically to inhibit apoptosis or nuclear factor. App-3 antibodies. The present sequence represents polypeptide sequence of the human Apo-2 ligand protein which is also reported to be involved in the Apo-2 intaid death. In the current invas massays in which is appopted to be involved in the Apo-2 ligand protein which is abore to be involved in the Apo-2 in a death of the appopunce of the human Apo-2 ligand protein which in whe competitive to be involved in the Ap
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the Apo-2 ligand protein was measured on human lymphoid cells

The Apo-3 polypeptides are useful for stimulating or inducing apoptotic activity in mammalian cells e.g. cancer cells, or for in vivo or ex vivo gene therapy techniques. The Apo-3 chimeric molecules are useful for inhibiting apoptosis, or as immunogens used in generating antibodies. The antibodies may be used to block excessive apoptosis, for instance in neurodegenerative disease, or to block potential autoimmune/ inflammatory effects of Apo-3 resulting from NP-kappaB activation. The uncleic acid sequences are useful as diagnostics for tissue-specific typing, for preparing Apo-3 polypeptides, or for generating transgenic or knockout animals. The transgenic or knockout animals are useful in

The invention relates to an isolated secreted and transmembrane polypeptide, designated as PRO polypeptide, PRO polypeptide lacking its associated signal peptide or PRO polypeptide can antibody without its associated signal peptide. The PRO polypeptide or an antibody binding to it is useful for inhibiting the growth of a tumor cell. A composition containing a PRO polypeptide is useful for inhibiting neoplastic cell growth or for treating a tumour, preferably cancer (such as liver, breast, ovarian, renal, colorectal, uterine, prostate, lung, bladder, gastric, pancreatic, vulval, thyroid, central nervous system cancer, hepatic carcinomas, sarcomas, qlioblastomas, melanoma or leukaemia) in a mammal. The PRO polypeptide is useful for identifying its agonists. The PRO polypeptide or an antibody binding to it is useful in the preparation of a medicament for treating a condition which is responsive to the PRO polypeptide or an antibody binding to it. The PRO polypeptide or an antibody binding to it is also useful for treating curveronal, glial, astrowal, blastocolic, inflammatory, angiogenic and immunologic disorders. The present sequence represents the amino acid sequence of a PRO polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

comprises measuring the expression level of tumour necrosis factor (TNF) - related apoptosis inducing ligand (TRAIL) gene in a specimen from the patient and comparing this level with the level in healthy persons. TRAIL gene expression is decreased in patients. The nucleic acids and polypeptide can be used to screen for agents for the treatment of allergic diseases, possibly using a transgenic rodent as a model animal for the disease, with effectiveness determined by changes in expression levels or protein activity. The method is useful for the diagnosis, examination, prevention and treatment of allergic diseases, including atopic skin inflammation. The sequence presented is the human TRAIL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the union relates to antibodies of the invention are useful for treating, receptors (TRAIL-R). Antibodies of the invention are useful for treating, preventing or ameliorating cancer (e.g. cancers of pancreas, uterine, preventing or ameliorating cancer (e.g. cancers of pancreas, uterine, preventing or ameliorating cancer (e.g. cancers of pancreas, uterine, whyperproliferative disorders, neurodegenerative disorders (e.g. parkinson's disease, Alzheimer's disease and Huntington's disease), autoimmune disorders (e.g. lupus, rheumatoid arthritis, multiple sclerosis, myasthenia gravis, Hashimoto's disease and immunodeficiency syndrome, inflammatory disorders (e.g. asthma, allergic disorders and rheumatoid arthritis), infectious diseases (e.g. acquired immune deficiency syndrome; AlbS, herpes viral infections and other viral infections), myelodysplastic syndromes (e.g. aplastic anaemia), graft-versus-host disease, ischaemic injury, liver injury, toxin-induced liver disease, septic shock, cachexia, anorexia and proliferative disorders.

Antibodies of the invention are also useful for treating cardiovascular disorders, carebrovascular disorders, thrombotic microangiopathies, and ulcerative colitis and for wound healing. The invention is also used the new accines. The present sequence is human TRAIL protein also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an antibody that specifically binds: (a) the human tumor necrosis factor (TNP) related apoptosis inducing ligand (TRAIL) protein appearing as ABU08558; (b) a soluble human TRAIL polypeptide; (c) a polypeptide comprising amino acids 124-276 of ABU08558, or (d) a fragment of the TRAIL protein. Also included is an antigen-binding fragment of the antibody (a monoclonal antibody), a hybridoma cell line that produces the antibody. The antibody), a assays to detect the presence of TRAIL polypeptides, either in vitro or in vivo, purifying TRAIL by affinity chromatography, blocking binding of TRAIL to target cells and thus inhibiting a biological activity of TRAIL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            124. .276

ö
The antibody is useful for treating disorders mediated or exacerbated by TRAIL, e.g. thrombotic microangiopathies, e.g. thrombotic thrombotycypaenic purpura (TTP), adult haemolytic uraemic syndrome (HUS) (even though it can strike children as well) small blood vessel clotting disorders e.g., cardiac problems in paediatric AIDS patients and systemic lupus erythematosus (SLE). The present sequence represents human TRAIL
                                                                                                                                                                                                                                                                                                                                                240
                                                                                                                                                                                                                                                                                                                                                                                                                          240

            the detection, prevention and treatment of disease. In one embodiment, the heterotrimeric comprises full-length or extracellular portions of TRAIL and full-length or extracellular portions of TRAIL and full-length or extracellular portions of other TNF ligand family members, preferably RANKL. The heterotrimeric complexes of the invention are useful for treating an autoimmune disease, cancer or osteoporosis, and particularly for inhibiting cancer cell proliferation, increasing B cell proliferation, or inducing apoptosis of T cells. A claimed method of inducing apoptosis of T cells and retrotrimeric complex consisting of Faal and LIGHT, TNF-alpha. Inmphotoxin-beta or TRAIL. A claimed method of inhibiting cancer cell proliferation involves administering a heterotrimeric complex consisting of comprises administering an antibody against a complex comprising RANKL and TRAIL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

The invention relates to an isolated antibody comprising a first amino acid sequence having 95 % identity to a second amino acid sequence of acid sequence having 95 % identity to a second amino acid sequence of either variable heavy chain or light chain-complementarity determining regions (WHCDR1)/VLCDR1, WHCDR2/VLCDR2 or WHCDR3/VLCDR3 appearing as ABG71996-ABG71911 being specific for human TRAIL receptors 1-4 (TMF (Tumour necrosis factor) related apoptosis-inducing ligand receptor, also known as TR4, TR5, TR7 and TR10). Also included are an isolated cell that produces the antibody, an antibody that binds the same epitope on a TR4 polypeptide or detecting, diagnosing, prognosing or and other hyperproliferative disorders) using the antibodies, a cancers, and other hyperproliferative disorders) using the antibodies, a cancer of whyridoma cell line selected from the hybridoma cell lines contained in hybridoma cell lines antibodies expressed by these cancers and pra-1313 and the antibodies expressed by these cancers and pra-1313 and the antibodies expressed or decreased apoptosis, e.g. cancer (such as colon, prease, useful for diagnosing or treating a disease or disorder associated with increased decreased apoptosis, e.g. cancer (such as colon, prease, useful for spanceatic, lung, gastrointestinal, and Kaposi's sarroma), graft-versus-color disease (WHD), infectious disease, acquired immunodeficiency syndrome (AIDS), or neurodegenerative disorders (e.g. Alzheimer's disease, about as theumatosid arthritis, and pooriasis, cardiovascular disorders, in promoting angiogenesis, wound healing, and in regulating immune response. Comprody is administered in combination with a chemotherapeutic agent as the body is administered in combination with a chemotherapeutic agent carbibody is useful as a diagnosic tool to monitor the expression of antibody is useful as a diagnosic tool to monitor the expression of a human TRALL receptor expression on cells, to detect, purify, and target the colory and in immunosasy's for qualitatively

Novel isolated antibody that immunospecifically binds tumor necrosis factor delta, useful for treating, preventing or ameliorating Non-Hodgkin's lymphoma, multiple myeloma, rheumatoid arthritis or Sjogren's syndrome.

Disclosure; Page 216-217; 225pp; English.

The invention relates to a novel antibody or its fragment, which immunospecifically binds tumour necrosis factor Delta (TNF-delta/APRIL). The antibody of the invention has dermaclogical, immunosuppressive, antialtergic, antiathritic, cytostatic, antianaemic, antialtarthritic, cytostatic, antianaemic, antialtarthritic, cytostatic, antianaemic, cutialtarthritic, antibosoriatic, antianaemic, antialtarthritic, cytostatic, antianaemic, antialtarthritic, cytostatic, antianaemic, antialtarthritic, antibosoriatic, antianaemic, antialtarthritic, antibosoriatic, antianaemic, antianaemic, antianaemic, antianaemic, antianaemic, antianaemic, antianaemic, antianaemic, antianathritic, antibosoriatic, and haemostatic activity.

The antibody or its fragment are useful for treating, preventing or ameliorating cancer such as Non-Hodgkin's lymphoma or multiple myeloma in host disease (GVHD). The autoinmune disease is systemic lupus cythematosus, rheumatoid arthritis or Sjogrem's systemic lupus cytheatesus, rheumatoid arthritis or Sjogrem's systemic lupus cytheatesus or disorder associated with aberrant APRIL or ARRIL receptor expression or aberrant function of APRIL or ARRIL receptor expression or aberrant function of APRIL or ARRIL receptor as autoimmune neutropenia, haemolytic anaemia, dermaritis, cuberculosis, diaberes mellitus, psoriasis, cancer of the immune system, particularly B cell cancers, immune disorders such as myasthenia gravis, Hashimoto's disease, immunodeficiency syndrome (AIDS)), and infectume necrosis factor TRAIL

treating, preventing or ameliorating cancer (e.g. colon, breast, uterine, present line present line present line present line present line presents the preventing or ameliorating cancer (e.g. colon, breast, uterine, pancreatic, lung, gastrointestinal or central nervous system cancer e.g. medulloblastoma, neuroblastoma, glioblastoma and Kaposi's sarcoma) in human. They are useful for detecting expression of TR4 polypeptide and detecting disposing, prognosing or monitoring cancers and other hyperproliferative disorders. Antibodies of the invention are useful for treating, preventing neurodegenerative disorders (e.g. Alzheimer's disease, arkinoor's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, cerebellar degeneration and Huntington's disease, cerebellar degeneration and Huntington's disease, cerebilar degeneration and Huntington's disease, cerebilar degeneration and Huntington's disease, commune disorders (e.g. lupus, rheumatorid arthritis, mustabhenia gravis, immune-related glomerulonephritis, mustabhenia gravis, collymyositis, immune-related glomerulonephritis, myandrome (Algorders (e.g. asthma, allergic disorders and rheumatoid arthritis), chapters (e.g. asthma, allergic disorders and rheumatoid arthritis), cherpes viral infections and other viral infections) and proliferative disorders. They are also useful for treating cardiovascular disorders including peripheral concexia and toxin-induced liver diseases (such as alcohol). They are also useful for treating cardiovascular disorders including peripheral cancerial infertion and ocular disorders, for wound healing, for with neovascularisation and ocular disorders, for wound healing, for treating and as adjuvants to enhance immune responsiveness to specific antigeness and as adjuvants to enhance in wunner and protein therapy and transplantation or recovery from surgery, trauma, radiation therapy and transplantation are sequence is human TR4 ligand, TRAIL protein in the invention invention relates to novel antibodies that immunospecifically Novel antibody useful for treating cancers and other hyperproliferative disorders, immunospecifically binds to TRAIL receptor and comprises variable heavy or light chain complementarity determining regions. Vaughan TJ; Dobson CL, Rosen CA, Albert VR, Disclosure; Page 300-301; 301pp; English. Ruben SM, used in the invention present Salcedo T,

The invention relates to a combination comprising CDNAs which are expressed in a disorder or process associated with DNA methylation. The combination and cDNAs are useful for diagnosing, staging, treating or monitoring treatment of cancer, e.g. colon cancer and for detecting changes in expression of genes encoding proteins that are associated with DNA methylation. The protein is useful for screening molecules or compounds to identify at least one ligand that binds to the protein and for producing an antibody. The present sequence represents the amino acid sequence of a protein expressed in a disorder or process associated with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated antibody or its fragments such as VHCDR1 (heavy chain variable domain complementarity determining region), VHCDR2, VHCDR3, VLCDR1 (light chain variable domain complementarity determining region), VLCDR2 (Light chain variable domain complementarity determining region), VLCDR2 or VLCDR3. The antibody or its fragment immorsopecifically binds TRAIL (tumour necrosis factor; TNR-related repoptosis-inducing ligand) receptor 7 (TR7). TR7 is also referred to as TRAIL receptor 2 (TRAIL. FC), death receptor 5 (DR5) and KILLER. The antibody or its fragment is useful for treating, preventing or ameliorating a cancer, e.g. colon, breast, uterine, pancreatic, lung or gastrointestinal cancer or Kaposi's sarcoma or cancer of the central nervous system such as medulloblastoma, neuroblastoma or glioblastoma or graft versus host disease, AIDS (acquired immune deficiency syndrome) or a neurodegenerative disorder. The invention is useful in antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel isolated Apo-2 ligand variant polypeptide having a sequence that differs from the native sequence. In Aving 281 and acids given in specification. The Apo-2 ligand variant polypeptide is selected from a polypeptide having substitutions at residue positions identified from x-ray crystal structure of the DRS.Apo2L complex. The polypeptide having the substitutions made at residue positions (s) selected from 20 positions such as 596C, S101C, S11C, V114C, R115C, E16C, M134C, M140C, B144C, M152C, S153C, R170C, R170K, R170S, K179C, D234C, E249C, R255C, E263C, H264C, such that the CRS Apo2L complex, and displays high solvent accessibility in the crystal structure of the DRS.Apo2L complex. The Apo-2 ligand variant polypeptide and further compositions have the following activities: cytostatic, and tarthritic and neuroprotective. The Apo-2 ligand variant polypeptide, an Apo-2 ligand composition or an Apo-2 ligand trimer are useful for inducing apoptosis in mammalian cells, by exposing mammalian cells are composition or an Apo-2 ligand variant polypeptide, therapeutically effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. The mammalian cells are colon or colorectal cancer cells. The Apo-2 ligand variant polypeptide,

the Apo-2 ligand composition or the Apo-2 ligand trimer is useful for treating cancer (such as lung, breast, colon or colorectal cancer) or an immune-related disease (such as arthritis or multiple sclerosis) in a mammal, by administering to the ammal an effective amount of the Apo-2 ligand variant polypeptide, Apo-2 ligand composition or Apo-2 ligand trimer. This sequence represents the native human Apo-2 ligand protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

                                                           tumour necrosis factor family ligand. A composition comprising the isolated antibody or its fragment is used for treating an individual in need of decreased level of endokine alpha activity. The endokine alpha polypeptide present in a heterotrimeric complex is used for treating an individual having a disorder associated with excessive bone resorption, e.g. osteoporosis, Paget's disease or arterial calcification. Treating an individual having a disorder associated with insufficient bone resorption comprises administering an endokine alpha antagonist, which is the antibody that binds specifically to endokine alpha polypeptide. The present sequence represents the amino acid sequence of a tumour necrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            180

the response to cerial to treatment with a compound title included the control of pathway. Also described: (1) predicting whether a compound is capable of modulating the activity of cells, comprising obtaining a sample of cells, determining whether the cells express a plurality of markers, and determining whether the cells express a plurality of markers, and correlating the expression of the markers to the compound's ability to correlate the activity of the cells; (2) a plurality of cell lines for identifying polymucleotides and polypeptides whose expression levels correlate with compound sensitivity or resistance of cells associated with a disease state, and (3) identifying polymucleotides and colls correlated with a disease state, compound sensitivity or resistance of cells associated with a disease state, and subjecting the plurality of associated with a disease state, compounds sensitivity or resistance of cells compounds that predict the sensitivity or cell since to polymucleotides or polypeptides that predict the sensitivity or cells associated with a disease state by using the expression pattern of the microarray of polymucleotides and collymucleotides and polypeptides are useful in predicting the carrivity of compounds that interact with protein tyrosine kinase pathways. These may be used in determining drug concern tyrosine kinase pathways. These may be used in determining drug sensitivity in patients to allow the development of individualized cancern based on patient response at a molecular level. The present concern based on patient response at a molecular level. The present concern based on patient response at a molecular level. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to novel human genes and gene product which are implicated in certain disease states. Compounds which modulate the proteins of the invention may have cytostatic, antiinfilammatory. Ophthalmological, antiateriosclerotic or vulnerary activities. The sequences of the invention may be useful for gene therapy. The invention may be useful for gene therapy. The invention may be useful for gene therapy. The invention may be useful for diagnosing or treating a hypoxia-regulated condition, erthropoiesis, andiogenesis, apoptosis, inflammation, erythropoiesis or the biological response to hypoxia conditions including processes such as glycolysis, glucomeogenesis, glucome synthesis. The disease such as glycolysis, iron transport or nitric oxide synthesis. The disease includes cancer, ischaemic conditions, reperfusion injury, retinopathy, neonatal stress, pre-eclampsia, atherosclerosis, a disease related protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New substantially purified polypeptide, useful for diagnosing or treating a hypoxial aregulated condition, such as cancer, ischemia, reperfusion injury, retinopathy, pre-eclampsia, atherosclerosis, inflammation, or wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240

The invention relates to methods and compositions for treating or ameliorating a disease or disorder of the gastrointestinal tract. The method involves administering a composition comprising tumour necrosis factor (TNF)-gamma-beta and its receptors DR3 and TR6 to a person with, or suspected of having the disease or disorder. The antagonist of TNF-amma-beta is useful for treating or ameliorating a gastrointestinal tract disease or disorder, specifically an inflammatory bowel disease, e.g. Crohn's disease or ulcerative colitis. The present sequence is human TRAIL protein. This sequence is used to illustrate the method of the
                                                                                                                                                                                                   Gastrointestinal tract disorder; tumour necrosis factor; TNF; DR3; TR6; TNF-gamma-beta protein; inflammatory bowel disease; Crohn's disease; ulcerative colitis; TRAIL; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      tumor necrosis factor gamma-beta antagonists for treating or rating a disease or disorders of the gastrointestinal tract, natory bowel disease, Crohn's disease or ulcerative colitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Wei

```
The invention relates to a composition comprising several CDNAs that are differentially expressed in a liver disorder. The composition is useful for treating liver disorder such as hyperlipidaemia, hypertenaton, type I diabetes, tumours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of screening several molecules or compounds to identify a ligand which specifically binds a cDNA. A protein encoded by the cDNA is useful for a high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combining the protein encoded by the cDNA with several of molecules or compounds under conditions to allow specific binding, and detecting specific binding between the protein and a molecule or compound, therefore identifying a ligand which specifically confides the protein. The composition is useful for detecting and quantifying differential gene expression, can be used in gene therapy, to formulate prognosis and to design a treatment regimen and to monitor the

The invention relates to a novel isolated Apo-2 ligand variant polypeptide. Comprising a sequence that differs from the native sequence Apo-2 ligand polypeptide sequence comprising 882 amino acids and having one or more following amino acid substitutions at the residue positions comprising S96C, S101C, S111C, R170C or K179C. Also disclosed is an isolated nucleic acid molecule comprising the Apo-2 ligand variant polypeptide. Further disclosed are a composition comprising the Apo-2 ligand variant polypeptide in mammalian cells. The Apo-2 ligand variant polypeptide is useful for preparing a composition for treating cancer, and method of inducing apoptosis in mammalian cells. The Apo-2 ligand variant polypeptide is useful for preparing a composition for treating cancer or immune-related disease, e.g., arthritis or multiple sclerosis. The current sequence represents the human Apo-2 ligand amino acid sequence. Note: The variant sequence that is referred to in claim 17 may contain one or more of the potential substitutions highlighted in the features
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DDSYMDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120

The invention relates to a novel isolated Apo-2 ligand variant polypeptide, comprising a sequence that differs from the native sequence Apo-2 ligand polypeptide sequence comprising 282 amino acids and having one or more following amino acid substitutions at the residue positions comprising S96C, S101C, S111C, R170C or K179C. Also disclosed is an isolated nucleic acid molecule comprising DNA encoding the Apo-2 ligand variant polypeptide. Further disclosed are a composition comprising the Apo-2 ligand variant polypeptide, a method of treating cancer, and a method of finducing apoptosis in mammalian cells. The Apo-2 ligand variant polypeptide is useful for preparing a composition for treating cancer or immune-related disease, e.g., arthritis or multiple sclerosis. The current sequence represents the human Apo-2 ligand amino acid sequence. Note: The variant sequence the human Apo-2 ligand amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         121 RVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNGELVIHEKG 180

The invention relates to a novel isolated Apo-2 ligand variant polypeptide, comprising a sequence that differs from the native sequence Apo-2 ligand polypeptide sequence comprising 282 amino acids and having one or more following amino acid substitutions at the residue positions comprising S96C, S101C, S111C, R170C or K179C. Also disclosed is an isolated nucleic acid molecule comprising DNA encoding the Apo-2 ligand variant polypeptide. Further disclosed are a composition comprising the Apo-2 ligand variant polypeptide, and enchod of treating cancer, and a method of inducing apoptosis in mammalian cells. The Apo-2 ligand variant polypeptide a composition for treating cancer or

The invention relates to a novel isolated Apo-2 ligand variant polypeptide, comprising a sequence that differs from the native sequence Apo-2 ligand polypeptide sequence comprising 282 amino acids and having one or more following amino acid substitutions at the residue positions comprising S96C, S101C, S111C, R170C or K179C. Also disclosed is an isolated nucleic acid molecule comprising DNA encoding the Apo-2 ligand variant polypeptide. Further disclosed are a composition comprising the Apo-2 ligand variant polypeptide, a method of treating cancer, and a method of inducting apoptosis in mammalian cells. The Apo-2 ligand variant polypeptide is useful for preparing a composition for treating cancer or immune-related disease, e.g., arthritis or multiple sclerosis. The current sequence represents the wild-type human Apo-2 ligand amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DDSYMDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120

The invention relates to a novel isolated Apo-2 ligand variant polypeptide, comprising a sequence that differs from the native sequence to Apo-2 ligand bolypeptide sequence comprising 282 amino acids and having one or more following amino acid substitutions at the residue positions comprising S96C, 5101C, 5111C, R170C or K179C. Also disclosed is an isolated nucleic acid molecule comprising DNA encoding the Apo-2 ligand variant polypeptide. Further disclosed are a composition comprising the Apo-2 ligand variant polypeptide, a method of treating cancer, and a method of inducing apoptosis in mammalian cells. The Apo-2 ligand variant polypeptide is useful for preparing a composition for treating cancer or immune-related disease, e.g., arthritis or multiple sclerosis. The current sequence represents the human Apo-2 ligand amino acid sequence. Note: The variant sequence that is referred to in claim 10 may contain and for this record
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DDSYMDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120

```
The invention relates to apoptosis inducing molecule-I protein (AIM-I)

comprising sequence that is 70 % identical to AD53976 or its mature form
where the polypeptide binds antibody specific to AIM-I, induces apoptosis
of cell line derived from pathological tissue and induces apoptosis of
cells. Also included are a composition comprising AIM-I and a carrier,
AIM-I produced by a process involving expressing in a host cell a nucleic
acid that encodes the protein so as to produce the protein (where the
cucleic acid is chosen from a polynucleotide encoding AIM-I, mature AIM-
cucleic acid is chosen from a polynucleotide encoding AIM-I, mature AIM-
cucleic acid is chosen from a polynucleotide that is complementary to
complete the protein so as to sequence encoded by human cDNA contained in
ATCC Deposit No. 9448, and a polynucleotide that is complementary to
consisting of 0.5 x SSC (Saline-Sodium Citrate) and 0.1 % sodium dodecyl
sulphate (SDS) to a polynucleotide chosen from polynucleotide encoding
mature/AIM I, and a polynucleotide chosen from polynucleotide encoding
contained in ATCC Deposit No. 97448, where the
by human cDNA contained in ATCC Deposit No. 97448, where the
colynucleotide encodes a polypoptide that has the sme biological
cattivity as described above). AIM-I is useful for treating
colynucleotide above). AIM-I is useful for treating
colynucleotide above). AIM-I is useful for treating
colynucleotide chosens, graft versus host disease, for
consisting peripheral tolerance, destroying pathologic transformed cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel apoptosis inducing molecule polypeptide that induces apoptosis of cell line derived from pathological tissue and induces apoptosis of T cells, useful for treating lymphadenopathy, autoimmune diseases and graft
                                                                                                                                                                            Human; apoptosis inducing molecule 1; AIM-1; apoptosis; autoimmune disease; graft versus host disease; lymphadenopathy; immunosuppressive; vasotropic; cytostatic; peripheral tolerance; cell activation; cell proliferation; immune regulation; inflammatory response; systemic lupus erythematosus; inflammatory disease; neoplasm; tumour; restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                            39. .281

lines, mediating cell activation and proliferation. AIM-1 proteins are functionally linked as primary mediators of immune regulation and inflammatory response, are useful for diagnosis and treatment of disorders of cells, tissues and organisms. AIM-1 is useful as research tool in elucidating biology of autoimmune disorders including systemic lupus erythematosus, immunoproliferative disease lymphadenopathy and is useful for inhibiting neoplasia such as tumour cell growth. AIM-1 is also useful to treat diseases which required growth promotion activity e.g., restenosis. AIM-1 is useful for assessing AIM-1 binding capacity of its binding molecules such as receptor molecules. The present sequence

                                                The invention relates to antibodies specific to apoptosis inducing molecule-I (AIM-I) polypeptides. The invention is useful in research, biological, diagnostic, clinical or therapeutic applications. It is also used for modulating activation and differentiation of cells, both normally and in disease states, or for mediating apoptosis and preventing or treating autoimmune diseases, graft-versus-host disease or lymphadenopathy. The invention is also useful in gene therapy. The present sequence is human AIM-I protein.
